The present invention describes a method (M1) for identifying a polynucleotide (I) of a microbe (M) that is expressed in vivo. (M1) comprises: (a) absorbing antibodies (Ab) against antigens that are expressed by (M) in vivo and in vitro with cells or cellular extracts of (M) that have been grown in vitro; (b) isolating unadsorbed Abs; and (c) probing an expressed in vivo is identified. The method can be used for identifying antigens expressed during an actual microbial infection. The identified polynucleotides are useful for vaccine design, diagnostics and antibiotherapy, in particular for the diagnosis and therapy of Actinobacillus actinomycetemcomitans infection, which is the etiologic agent for localised juvenile periodontitis. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                    Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying microbial polynucleotides, useful for vaccine design, diagnostics and antibiotherapy, comprises isolating clones of a microexpression library reactive with antibodies against microbe proteins produced during in vivo growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Progulske-Fox A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           06-AUG-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 04-AUG-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
      B
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression CC of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid CC encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated CC polypeptide or its fragment whose expression is inhibited by the antisense cC antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular CC proliferation or the activity of a gene in an operon required for CC proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway of identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound s activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes Note: The sequence data for this patient did not form part of the printed specification, but was obtained in electronic format directly from WIDO at

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

The antisense nucleic acids are useful for identifying proteins or screening for homologous mucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained for financial information in fundamental.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any one of CC the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: CC (1) a vector comprising a promoter operably linked to the nucleic acid concoding a polypeptide whose expression is inhibited by the antisense concoding a polypeptide whose expression is inhibited by the antisense concoding a polypeptide whose expression is inhibited by the antisense concoding a polypeptide (2) a host cell containing the vector; (3) an isolated containing the polypeptide by the antisense contained that inhibited by the antisense contained (2) antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway of that that proliferation, (8) compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the extent to which each of the strains is present in a culture or collection of compound's activity; (11) a culture compound that inhibits the gene condition that inhibits the extent to which each of the strains is present in a culture or collection of compound that inhibits the condition of conditions or screening for homologous nucleic acids are useful for cellular proliferation to isolate candidate molecules for rational conditions of the target prokaryotic essential genes. Note: The sequence is encoded by one of the patient did not form part of the printed specification, but was obtained of the prokaryotic essential genes. Note: The sequence data for this conditions and condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC66610-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent
                                                                                                                                                                             New isolated protein complexes useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfer with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                              Disclosure; SEQ ID NO 2249; 17pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8888888
the 6213 antisense sequences given in the specification where expression (C) of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense concleic acid; (2) a host cell containing the vector; (3) an isolated (C) polypeptide or its fragment whose expression is inhibited by the antisense contisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for crowliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) contentifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    06-SEP-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3203
AF
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         21-MAR-2001; 2001US-00815242.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the gene product or that has an activity against a biological pathway or required for proliferation, or that inhibits cellular proliferation; (8) consideration and the biological pathway in which a proliferation-required fee or its gene product lies or a gene on which the test compound that inhibits proliferation of an occupanism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or the strains; or compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required or cellular proliferation in cisolate candidate molecules for rational conditions of compound that inhibits the required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this gratent did not form part of the printed specification, but was obtained of the printed specification, but was obtained of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the 6213 antiteense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: C(1) a vector comprising a promoter operably linked to the nucleic acid concoding a polypeptide whose expression is inhibited by the antisense conculsic acid; (2) a host cell containing the vector; (3) an isolated of polypeptide or its fragment whose expression is inhibited by the antisense containing the vector; (3) an isolated of polypeptide; (6) producing the polypeptide; (6) inhibited by the containing the polypeptide; (6) inhibited by the continuous polypeptide; (7) identifying a gene in an operon required for proliferation or the activity of a gene in an operon required for containing the polypeptide; (6) inhibiting cellular containing the proliferation or that has an activity against a biological pathway of the gene product or that has an activity against a biological pathway of containing a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an occupanism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of which each of the strains is present in a culture or collection of containing the extent of contains; or (13) identifying the target of a compound that inhibits the containing activity or collection of an occupanism. The antisense nucleic acids are useful for identifying proteins or screening for homologous mucleic acids required contained the discovery programs, or for screening homologous purched acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression CC of the nucleic acid inhibits proliferation of a cell. Also included are: CC (1) a vector comprising a promoter operably linked to the nucleic acid; (2) a host cell containing the vector; (3) an isolated CC encoding a polypeptide whose expression is inhibited by the antisense CC continued acid; (2) a host cell containing the vector; (3) an isolated CC polypeptide; (5) producing the polypeptide; (6) inhibiting cellular CC proliferation or the activity of a gene in an operon required for CC the gene product or that has an activity against a biological pathway in which a proliferation, or that inhibits cellular proliferation or proliferation, or that inhibits cellular proliferation of the test compound that inhibits proliferation of an CC compound's activity; (11) a culture comprising strains in which the gene product lies or a gene on which the test compound that inhibits proliferation of an CC compound's activity; (11) a culture comprising strains in which the gene CC product is overexpressed or underexpressed; (12) decermining the extent to which each of the strains is present in a culture or collection of CC strains; or (13) identifying the target of a compound that inhibits the the gene CC proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, C for screening homologous nucleic acids of the target prokaryotic essential genes. Note: The sequence data for this compound that of the printed specification, but was obtained compound that of the printed specification, but was obtained compound that cale for this path of the printed specification, but was obtained compound that cale for this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the isolation of genes and their encoded correspond from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the geneme of P. luminescens can detection/amplification of the genes. Antibodies (Ab) raised against the gelection/amplification of the genes. Antibodies (Ab) raised against the golymorphisms, for gene analysis and for carry agene-containing vector are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing the toxins and antibiotics produced by P. Compounds to response or sensitivity to toxins and antibiotics produced by P. Compounds to express the genes and are able to alter recombinant production of the proteins, particularly toxins and carry agenes. Cells transformed to express the genes are useful for carry activities. The genes, proteins, vectors containing the genes and Ab are also useful that the genes, proteins, vectors containing the genes and Ab are also useful that are sensitive to P. luminescens-encoded toxins or antibiotics) and as carry sensitive to P. luminescens-encoded toxins or antibiotics) and as the genes are useful that are sensitive to P. luminescens encoded toxins or antibiotics) and as cators and for identifying targets of human diseases for which P. Compounds that in the proteins are as virulence to the proteins are as virulence of the isolated P. luminescens proteins.
                                                                                                                                                                                                                                                                                                                                                                                                  뫉

The present invention relates to the genome sequence of Listeria CC monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of ct are useful for selecting probes and primers for detecting genes in L. CC monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present invention. Proteins componed by the genome sequence of the present invention. Proteins carriessed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and cf or biosynthesis and biodegradation, especially biosynthesis of Vitamin CC antibodies, identification of L. monocytogenes and related organisms, and cf or biosynthesis and biodegradation, especially biosynthesis of Vitamin CC selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and sequence and proteins encoded by it are useful in pharmaceutical and compositions for the treatment or prevention of infections by L. concocytogenes and related organisms. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in the printed specification, but was obtained to composition the differently from WIPO at

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression CC of the nucleic acid inhibits proliferation of a cell. Also included are: CC (1) a vector comprising a promoter operably linked to the nucleic acid; (2) a host cell containing the vector; (3) an isolated CC nucleic acid; (2) a host cell containing the vector; (3) an isolated CC polypeptide or its fragment whose expression is inhibited by the antisense control or the activity of agent in similar the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular CC proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway of the gene product or that has an activity against a biological pathway of cellular proliferation, or that inhibits cellular proliferation or the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling an activity; (11) a culture comprising strains in which the gene compound's activity; (11) a culture comprising strains in which the gene compound's activity; (11) a culture comprising strains in which the gene compound's activity; (11) a culture comprising strains in which the gene compound's activity; (11) a culture comprising strains in which the gene compound's activity; (11) a culture or collection of compound's activity; (11) a culture compound that inhibits the extent to which each of the strains is present in a culture or collection of compound's activity in the target of a compound that inhibits the extent to which each of the strains is present in a culture or collection of compound that inhibits the control of compound that inhibits the control of compound that inhibits the extent of compound that inhibits the control of compound that inhibits the control of compound that inhibits the control of control of control of control of control of control of control of control of control of control of contr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             21-MAR-2001;

                                                    Ş
                                                                                                                                                                                                                                                                                                       Enterococcus faecium encoding an Enterococcus faecium polypeptide having CC one of 10 fully defined sequences given in the (or comprising 40 cc sequential nucleotides chosen from any of the nucleic acids, its complement or sequences hybridising to it). Also included are a crecombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a sligle-stranded probe comprising the nucleic acid. The nucleic acids are chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions resulting from E. faecium bacterial infection (e.g. urinary tract infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida abbicans concleic acid is useful for recombinant production of Candida abbicans and vaccines containing the nucleic acid are useful for represents of treating Enterococcus faecium infections. The present sequence represents one if the disclosed E. faecium proteins.

The present sequence represents the amino acid sequence of an A. baumannii protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences AAU17977-AAU18087 represent immunoglobulin polypeptides of the CC invention. The polypeptides and their associated polynucleotides can be used to diagnose a pathological condition or a susceptibility to a CC pathological condition in a subject by determining the presence or amount of expression of the protein. Alternatively the identification of a binding partner to a sequence allows determination of changes in CC protein activity. The sequences can be used as research tools for receptors or other signal transduction pathway proteins that interact CC with the polypeptides of the invention and can be used to treat, prevent CC viagnose various types of disorders such as neurological disorders, CC cardiovascular disorders, sastrointestinal disorders, reproductive considered, immune system disorders, renal disorders, muscular disorders, considered, providers and cancer. Note: The sequence data for this patent did not form part of the printed CC specification, but was obtained in electronic format directly from WIPO cc at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel genes (ABV83682-ABV84101) and proteins CC (ABP66710-ABP67129) useful for preventing, treating or ameliorating CC medical conditions e.g. by protein or gene therapy. The genes are CC isolated from a range of human tissues disclosed in the specification. CC The nucleic acids, proteins, antibodies and (antiagonists are useful in CC the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and CC ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, CC breast, gastrointestinal tract, liver, lung, or urogenital, (b) immune CC disorders e.g. Addison's disease, allergies, autoimmune haemolytic canaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, CC multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) CC cardiovascular disorders such as myocardial ischaemias; (d) wound healing (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic confectious diseases such as viral, bacterial, fungal and parasitic confections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly axx
                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity individual activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC prokaryotic cellular proliferation, their use in identifying the genes, CC thair use in the discovery of novel antibiotics, the essential genes CC themselves and the encoded proteins. The prokaryotes used are Escherichia CC coli; Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, CC Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also CC useful for the identification of potential new targets for antibiotic CC development. The antisense nucleic acids can also be used to identify CC proteins used in proliferation, to express these proteins, and to obtain CC antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational draw discovery programmes. The CC antisense nucleic acid sequence is also useful to screen for homologous CC uncleic acids which are required for cell proliferation in a wide variety CC cellular proliferation protein. Note: The sequence data for this patent CC did not form part of the printed specification, but was obtained in CC electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN05044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biclogical sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying Streptococcus proteins

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 52976; 1766pp; English.

the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the The invention relates to an isolated nucleic acid comprising any one of

RESULT 38

ID ABU23 片 Ś ភពពិភពពិភពពិភពពិភពពិភពពិភពពិភពពិភពព cc antisense nucleic acid; (4) an antibody capable of specifically binding cthe polypeptide; (5) producing the polypeptide; (6) inhibiting cellular cc proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway crequired for proliferation, or that inhibits cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the gene condition of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational conditions of the proliferation in cells other than S. aureus, S. typhimurium, content acides are useful for the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the princed specification, but was obtained con electronic format directly from NIFO at Matches Query Match Best Local 21-MAR-2001; 2001US-00815242. 06-SEP-2001; 2001US-00948993. 25-OCT-2001; 2001US-0342923P. 08-FEB-2002; 2002US-00072851. 06-MAR-2002; 2002US-0362699P.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the 6213 antisense sequences given in the specification where expression cc (1) a vector comprising a promoter operably linked to the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid cencoding a polypeptide whose expression is inhibited by the antisense cc nucleic acid; (4) an antibody capable of specifically binding containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense containing the vector; (3) an isolated containing the vector; (3) an isolated containing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway or identifying a gene required for cellular proliferation or the biological pathway in which a proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound to a compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for strains; or (13) identifying the target of a compound that inhibits the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the compound that inhibits the extent of identifying proteins or screening for homologous nucleic acids are useful for cellular proliferation to isolate candidate molecules for rational carget prokaryotic essential genes. Note: The sequence data for this culture of proliferation in cells other than S. aureus, S. typhimurium, C. R. premission of the printed specification, but was obtained of the printed specification, but was obtained contained in electronic format directly from wipo at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

composition in the control of the nucleic acid problem in the comprising 40 composition in the lor comprising 40 complement or sequences hybridising to it. Also included are a complement or sequences hybridising to it. Also included are a complement or sequences hybridising to it. Also included are a composition regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid operably linked to chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. The mucleic acids is useful for diagnosing pathological conditions resulting from E. faecium bacterial infection (e.g. urinary tract infection, bacteraemia, endocarditis, wounds and abdominal pelvic infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans derived peptides or antisense polypeptides. Pharmaceutical compositions and vaccines containing the nucleic acid are useful for preventing or treating Enterococcus faecium infections. The present sequence represents cone if the disclosed E. faecium proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nuc

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 49339; 1766pp; English.

cut he sil anticense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: ((1) a vector comprising a promoter operably linked to the nucleic acid cenciding a polypeptide whose expression is inhibited by the antisense complete acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense complete acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (6) identifying a compound that influences the activity of a gene product or that has an activity against a biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound is activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of creations; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation to isolate candidate molecules for rational constructed for proliferation to isolate candidate molecules for rational constructed for proliferation in cells other than S. aureus, S. typhimurium, comprise processential genes. Note: The sequence data for this constructed for matching part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at The invention relates to an isolated nucleic acid comprising any one of

Sequence 2991, Application US/09540236

Patent Mo. 6673910
GENERAL INFORMATION:
APPLICAMT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO MORAXELLA CATAR
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 2709-205-001
CURRENT APPLICATION NUMBER: US/09/540,236
CCURRENT FILING DATE: 2000-04-04
NUMBER OF SEQ ID NOS: 3840
SEQ ID NO 2991
LENGTH: 118
